

1. Define the NAME variable and assign it your name. Display the content of this variable. Export this variable and check if it is available in the new (child) interpreter.
2. Display the list of exported variables.
3. Change your own prompt by modifying the PS1 variable.
4. Write a script that will sort it for each of the files given as call arguments content.
5. Write a script that will display in for each of the files given as call arguments subsequent lines, the 3 most frequently repeated words in it.
6. Write a script that will copy the file given as the first argument to each directory given as subsequent call arguments.
